SYNTHETIC QA ONLY - NOT A REAL EQUIPMENT MANUAL

Manufacturer: Test Bench
Model: FINDR-QA-100
Equipment: Fire alarm control panel
Document type: User guide
Revision: QA-027

This fictional fire alarm control panel exists only for browser verification. The model names, buttons and behaviour below do not describe real equipment. Confirm the equipment label before applying any actual manufacturer procedure. This fixture supports read-only questions about event history. It does not provide installer access codes, disablement procedures, electrical tests or authority to impair a fire alarm system. External equipment requires its own relevant manual. The event history records observations but does not establish whether the cause of a fault has been repaired or the system has been restored.

Manufacturer: Test Bench. Model: FINDR-QA-100. Revision: QA-027.

Section 2 - Viewing event history

For this fictional panel, the read-only event history is available from the front controls.

1. Press VIEW on the panel front.
2. Select EVENT HISTORY from the displayed menu.
3. Use the UP and DOWN buttons to browse the stored events.
4. Press BACK to leave event history.

The EVENT HISTORY menu is inside VIEW. Step two selects EVENT HISTORY after VIEW has already been opened. Viewing the log does not clear its entries or reset a fault. This synthetic panel retains 120 event entries. Record the exact event wording and time shown when investigating a fault. A cleared indication does not confirm its cause.

Section 3 - Limits of this guide

Walk test is not described in this user guide. Obtain the applicable installer manual and the installed configuration before answering how walk test is performed. The external power supply is a separate component. This panel guide does not establish the PSU terminal assignments, current rating or operating voltage.
